ATQ150 SERIES 9-75VDC INPUT / 150W OUTPUT 8:1 ISOLATED DC-DC CONVERTER

"Achieve Total Assurance and Quality in Power."

EFFICIENT - INNOVATIVE - VERSATILE

The ATQ150 Series provides a high-performance solution for demanding power conversion applications. With its 150-Watt output power, 9 - 75VDC input voltage and 8:1 input voltage range, this isolated DC-DC converter ensures reliable operation and high efficiency. It is engineered for robustness supports a wide operating temperature range and complies with industrial standards.

- I. Compliant with MIL-STD-1275^(*) with external components
- II. Compliant with MIL-STD-704^(*) with external components

NOTE:

* Suitable for COTS use. If the product is intended to be used with a military system, it must be tested in the internal structure of a system subject to military tests. ATAQ does not guarantee the use of this product in military and medical products.

NOTE:

1. The output terminal of 24Vout models required a minimum capacitor 100uF to maintain specified regulation
2. The input external capacitor recommends to parallel with 330uF ESR<0.5Ω to reduce the input ripple voltage

Figure-5

OUTPUT VOLTAGE ADJUSTMENT:

The Trim input permits the user to adjust the output voltage up or down 10%. This is accomplished by connecting an external resistor between the Trim pin and either the Vo (+) pin or the Vo (-) pin (TRIM pin). Please see Figure.

Only one of the trim-up or trim-down resistors should be used to increase or decrease the output voltage.

Figure-6

The Trim pin should be left open if trimming is not being used. Connecting an external resistor ($R_{trim-down}$) between the Trim pin and the Vout(+) (or Sense(+)) pin decreases the output voltage.

The following equation determines the required external resistor value to obtain a down percentage output voltage change of $\Delta\%$.

$V_{out}=24V$:

$$R_{trim_down} = 20 * \frac{(V_{o,set} - \Delta\% * V_{o,set} - 2.5)}{\Delta\% * V_{o,set}} - 100K\Omega$$

Where

For example, to trim-down the output voltage of 24V module (ATQ150-WH36S24) by 5% to 22.8V, $R_{trim-down}$ is calculated as follow:

$$\Delta\% = 5\%$$

$$R_{trim_down} = 20 * \frac{(24 - 5\% * 24 - 2.5)}{5\% * 24} - 100K\Omega$$

$$R_{trim_down} = 238.33K\Omega$$

Connecting an external resistor ($R_{trim-up}$) between the Trim pin and the Vout (-) (or Sense (-)) pin increases the output voltage. The following equations determine the required external resistor value to obtain an up percentage output voltage change of $\Delta\%$.

$V_{out}=24V$:

$$R_{trim_up} = 20 * \frac{(2.5 - \frac{0.46 * 100}{100 + 5.6})}{\Delta\% * V_{o,set}} - \frac{5.6 * 100}{100 + 5.6} K\Omega$$

Where

$$V_{out} = V_{o,set}, \Delta\% = \left(\frac{V_{desired} - V_{o,set}}{V_{o,set}} \right) \times 100$$

For example, to trim-up the output voltage of 24V module (ATQ150-WH36S24) by 5% to 25.2V, Rtrim-up is calculated as follow:

$$\Delta \% = 5\%$$

$$R_{trim_up} = 20 * \frac{(2.5 - \frac{0.46 * 100}{100 + 4.3})}{5\% * 24} - \frac{5.6 * 100}{100 + 5.6} K\Omega$$

$$R_{trim_up} = 29.013 K\Omega$$

The output voltage on 24V models is adjustable within the range of +10% to -10%.
